

CL249: ASSIGNMENT 7

Himanshu Chaudhary

200020059

Problem statement

We have to solve the given ODEs

$$\frac{dy_1}{dx} = -2y_1 + 4e^{-x}$$

$$y_1(x=0) = 2$$

$$\frac{dy_2}{dx} = \frac{-y_1 y_2^2}{3}$$

$$y_2(x=0) = 4$$

using Euler's Explicit Method for initial values given.

And plot y_1 vs x and y_2 vs x for different values of h .

Description of Method

Euler's Explicit method.

We divide ~~into~~ the interval into parts (N) and find the function using the formula.

$$x_{i+1} = x_i + h \quad h = \frac{b-a}{N}$$

$$y_{i+1} = y_i + h \left. \frac{dy}{dx} \right|_{x=x_i}$$

$$\frac{dy}{dx} = f(x, y) \text{ is the differential eq}^n$$

We are given initial values of y s at $x=0$.

PSEUDO CODE

main.m

Initialize Interval $[0, 4]$

loop for N

$$N = 2^{i-1}$$

get x_1, y_1, y_2 from solver

loop in $1: \text{length}(y_{\text{pre}})$

$$\text{error}_1 = \left| \frac{y_1(i) - y_{\text{pre}}(i)}{y_1(i)} \right|$$

loop in $1: 1_{\text{pre}}$

$$\text{error}_2 = \left| \frac{y_2(i) - y_{\text{pre}}(i)}{y_2(i)} \right|$$

plot (x, y_1)

plot (x, y_2)

solver.m

get arguments a, b, N

$$h = (b-a)/N$$

$$y_1(1) = 2, y_2(1) = 4;$$

loop from 1 to $(N-1)$

$$x_{i+1} = x_i + h$$

$$y_1(i+1) = y_1(i) + h(\text{derivative}_1)$$

$$y_2(i+1) = y_2(i) + h(\text{derivative}_2)$$

return

derivative.m

def arguments x, y_1, y_2

$$y_1' = f_1(x, y_1)$$

$$y_2' = f_2(x, y_1, y_2)$$

function $f_1(x, y_1)$

$$\text{return } -2y + 4e^{-x}$$

function $f_2(x, y_1, y_2)$

$$\text{return } \frac{-y_1 y_2^2}{3}$$
